

## Application instructions

Dear horse owner,

We are frequently asked, whether there are differences in the application of **KerbEX** compared to other products. We can not judge about other products, but to build up a long lasting effect you should apply **KerbEX** in the following way:

1. **KerbEX** is only for external application..
2. **KerbEX** can be applied with a sponge or a cloth or it can be sprayed.
3. **KerbEX** should not be used diluted, diluting the product leads to less effect.
4. During the first week apply daily covering a large area. Please pay attention not to apply KerbEx to mucous membranes or open wounds.
5. During the second week apply **KerbEX** every second day, during the third week about every third day. You will recognize, that insect attac has reduced significantly.

From now on you only apply **KerbEX**, when you observe, that insect attac is increasing again. According to satisfied **KerbEX** clients this will be every two or three days, during continuous rainfall the frequence may have to be increased.

**KerbEX** Special is a pure oil against black flies. Apply only a very thin film to the affected part of the skin. When you treat the ear conch, pay attention to apply a sufficient amount for protection, but take care that nothing gets into the tympanic membrane.

Following these application hints, there is no need to spray immediately before the ride proceeding from a midding insect attac.

If you have any questions about our products, we are at yur disposal. We wish you a nice time with your horse.
